

## Print Working Directory of an FTP Server with ftplib

### Description

You are tasked with creating a function that connects to an FTP server, logs in with the provided credentials, retrieves the current working directory, and then logs out using ftplib library. Your function should also print the login message, the current working directory, and the quit message.

### Function specification

```
def get_current_directory(host: str, username: str, password: str) -> str:
```

### Output (without unit test)

```
230 Login successful.  
current directory: /  
221 Goodbye.
```

### Output (with unit test)

```
230 Login successful.  
current directory: /home/user  
221 Goodbye.  
login called with call('user', '123')  
test attribute passed: /home/user is equal to /home/user
```
